Introduction

Given a set S, and a function $f: S \to \mathbb{R}$. An optimization problem is:

$$\max_{s.t.} f(x)$$
subject to (OPT)

- \bullet S feasible region
- A point $\overline{x} \in S$ is a feasible solution
- f(x) is objective function

(OPT) means: "Find a feasible solution x^* such that $f(x) \leq f(x^*), \forall x \in S$ "

- Such x^* is an **optimal solution**
- $f(x^*)$ is optimal value

Other ways to write (OPT):

$$\max\{f(x), x \in S\}$$
$$\max_{x \in S} f(x)$$

Analogous problem

$$\min f(x)$$

$$s.t. \ x \in S$$

Note

$$\max_{s.t.} f(x) = -1 \begin{pmatrix} \min -f(x) \\ s.t. & x \in S \end{pmatrix}$$

Problem x^* may not exist

a) Problem is unbounded:

$$\forall M \in \mathbb{R}, \exists \overline{x} \in S, \ s.t. \ f(\overline{x}) > M$$

- b) $S = \phi$, i.e. (OPT) is **INFEASIBLE**
- c) There may not exist x^* achieving supremum.

$$\max x$$

$$s.t. \ x < 1$$

supremum

$$\sup\{f(x): x \in S\} = \begin{cases} +\infty & \text{if OPT unbounded} \\ -\infty & \text{if } S = \emptyset \\ \min\{x: x \geq f(x), \forall x \in S\} & \text{otherwise} \end{cases}$$

always exist and are well-defined

infimum

$$\inf\{f(x):x\in S\}=-1\cdot\sup\{-f(x):x\in S\}$$

From this point on, we will abuse notation and say $\max\{f(x):x\in S\}$ is $\sup\{f(x):x\in S\}$.

One way to specify that I want an opt. sol. (if exists) is

$$x^* \in \operatorname{argmax}\{f(x) : x \in S\}$$

1.1 Linear Optimization (Programming)

or (LP).

$$S = \{ x \in \mathbb{R}^n : Ax \le b \}$$

where $A \in \mathbb{R}^{m \times n}, b \in \mathbb{R}^m$ and $f(x) = c^T x, c \in \mathbb{R}^n$.

$$\max_{x \in T} c^T x$$

$$s.t. \ Ax \le b \tag{LP}$$

Note

$$A = \begin{pmatrix} | & & | \\ A_1 & \cdots & A_n \\ | & & | \end{pmatrix} \qquad A = \begin{pmatrix} - & a_1^T & - \\ & \vdots & \\ - & a_m^T & - \end{pmatrix}$$

Clarifying

$$u, v \in \mathbb{R}^n$$
, $u \le v \iff u_j \le v_j, \forall j \in 1, \dots, n$

Note

 $u \not\leq v$ is not the same as u > v

$$\begin{pmatrix} 1 \\ 0 \end{pmatrix} \not \leq \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

Example:

$$\begin{array}{cccc} \max & 2x_1 + & 0.5x_2 \\ s.t. & x_1 & \leq 2 \\ & x_1 + & x_2 \leq 2 \\ & x & \geq 0 \end{array}$$

• Strict ineq. not allowed

halfspace, hyperplane, polyhedron

Let $h \in \mathbb{R}^n$, $h_0 \in \mathbb{R}$.

 ${x \in \mathbb{R}^n : h^T \le h_0}$ is a halfspace.

 $\{x \in \mathbb{R}^n : h^T = h_0\}$ is a hyperplane.

 $Ax \leq b$ is a **polyhedron** (i.e. intersection of finitely many halfspaces).

Example:

n products, m resources. Producing $j \in \{1, ..., n\}$ given c_j profit/unit and consumes a_{ij} units of resource $i, \forall i \in \{1, ..., m\}$. There are b_i units available $\forall i \in \{1, ..., m\}$.

$$\max \sum_{j=1}^{n} c_j x_j$$

$$s.t. \sum_{j=1}^{n} a_{ij} x_j \le b_i, \qquad \forall i = 1, \dots, m$$

$$x > 0$$

which is an LP.

1.1.1 Determining Feasibility

Given a polyhedron

$$P = \{x \in \mathbb{R}^n : Ax \le b\}$$

either find $\overline{x} \in P$ or show $P = \emptyset$.

Idea In 1-d, easy. \rightarrow Reduce problem in dimension n to one in dimension n-1.
